

GenAI, NLP and Prompt Engineering

MODULE 12

Assessment Day

Welcome to your final assessment for this course. Today you'll demonstrate your understanding through both examination and presentation—two complementary ways to showcase what you've learned about artificial intelligence, natural language processing, and prompt engineering throughout this module.

Assessment Day Overview

Today's session is designed to evaluate your comprehensive understanding of the key concepts we've covered. You'll engage in two distinct but equally important activities that together provide a complete picture of your learning.

MCQ Examination

A focused set of multiple-choice questions testing your conceptual understanding of GenAI, NLP, prompt engineering, and RAG systems.

Mini-Project Presentation

A concise two-minute presentation where you'll explain your project's purpose, functionality, and limitations with clarity.

Q&A Interaction

Brief clarification questions that allow you to demonstrate depth of understanding and thoughtful reasoning about your work.

- ❏ Remember: Today focuses on **understanding, clarity, and explanation**—not system complexity or coding depth. Quality of insight matters more than quantity of features.

Assessment Components

MCQ Exam

The examination portion tests your conceptual grasp of fundamental principles. You'll answer questions about GenAI capabilities, NLP techniques, prompt engineering strategies, and RAG system architecture.

- Concept-based questions requiring reasoning
 - Focuses on understanding, not memorization
 - Covers core topics from the entire module
-

Mini-Project Presentation

Your presentation is an opportunity to demonstrate how you've applied course concepts to solve a real problem. You'll explain your system's design, functionality, and boundaries in a clear, structured way.

- Single slide with key information
- Two-minute time limit—practice for conciseness
- Emphasis on clear explanation over technical jargon

MCQ Examination

The multiple-choice examination consists of 20 carefully designed questions that assess your understanding across the spectrum of topics we've explored together. This isn't about recalling facts—it's about demonstrating that you can reason about AI systems, understand their behavior, and make informed decisions.

01

Core Concepts

Questions about fundamental GenAI and NLP principles, including transformer architecture, embeddings, and language model capabilities.

02

Reasoning & Application

Scenario-based questions requiring you to apply concepts to solve problems or predict system behavior in specific contexts.

03

System Behavior

Questions testing your understanding of how RAG systems, prompts, and AI models interact and respond to different inputs and constraints.

Key insight: The exam checks **how well you understand** the underlying principles, not how much you've memorized. Think critically about each question and consider the reasoning behind different approaches.

Mini-Project Presentation

Your two-minute presentation is your opportunity to shine by clearly articulating what you've built and why it matters. Focus on telling a coherent story about your project that demonstrates both technical understanding and practical thinking.

1

The Problem

Clearly define what real-world challenge or need your project addresses. Why does this problem matter?

2

How It Works

Explain your system's retrieve-then-answer process. How does information flow from query to response?

3

Safety & Fallback

Describe how your system handles edge cases, maintains reliability, and responds when it doesn't have an answer.

4

One Key Limitation

Identify a clear limitation of your system. Understanding boundaries shows maturity and critical thinking.

- ❏ **Time management tip:** Practice your presentation multiple times. Two minutes passes quickly—aim for about 30 seconds per component. Clarity and structure matter more than covering every technical detail.

During the Presentation

When presenting, think of yourself as a consultant explaining your solution to stakeholders. Your goal is to build confidence that you understand not just what your system does, but why it works the way it does and where its boundaries lie.

What It Can Do

Demonstrate the core functionality and successful use cases. Show your system's strengths clearly.

What It Cannot Do

Honestly acknowledge limitations. This shows sophisticated understanding of system constraints.

Why It's Reliable

Explain your approach to ensuring accuracy, handling uncertainty, and maintaining trustworthy responses.

Source of Information

Clarify where your system retrieves information and how you ensure source quality and relevance.

Remember: Clear explanation matters more than technical detail. Your audience wants to understand your thinking, not just hear technical vocabulary. Speak with confidence about what you know, and be honest about what you're still learning.

In-Class Tasks

Let's review the specific activities you'll complete during today's assessment. Approach each task with focus and confidence—you've prepared well for this moment.

Complete MCQ Exam

Take your time with each question. Read carefully, think through the reasoning, and select the answer that best demonstrates your understanding of the concepts.

Present Mini-Project

Deliver your two-minute presentation with clarity and structure. Focus on explaining your system's purpose, mechanics, and boundaries in an engaging way.

Answer Questions

Respond thoughtfully to any clarification questions. This is your chance to elaborate on interesting aspects and show the depth of your reasoning.

You're Ready

You've spent weeks learning about GenAI, NLP, and prompt engineering. You've explored how large language models work, how to craft effective prompts, and how to build RAG systems that retrieve and generate reliable answers. Trust in your preparation, communicate clearly, and demonstrate the understanding you've developed.

Good luck on your assessment! 🚀
